
a Order of spectral averaging
|C_e|
arg C_e (rad)
C_{12}
C_{23}
C_{31}
Frequency (Hz)
Multiply first
$\langle \prod_e C_e \rangle_w$
Average first
$\prod_e \langle C_e \rangle_w$
Averaging weights
$w \propto K_{\mathrm{Hann}} S_{\mathrm{ii}}$
Im P
Frequency (Hz)
b Slopes within the window
9.75 Hz
10.25 Hz
Hann (2 s)
Relative height
$\Delta\tau = 125$ ms
Edge 12
23
31
Δd_e (rad)
Frequency (Hz)
Bias $\propto \mu_2 r'_e d'_e$
c Window-length scaling
$|\mathrm{Im}\, P_T(10\,\mathrm{Hz})|$
T^{-2}
Q_{bias}
T^{-4}
Window length T (s)
d Reversible latent counterexample
Nominal sign-flip test
First 99 $p = 0.00008$
Mean of 500
Density
Cross-half score Q (10^{-5})
